Kotlin

Peter Borovanský, KAI, I-18, borovan(a)ii.fmph.uniba.sk

Kotlin

Kotlin is the New Official Language of Android
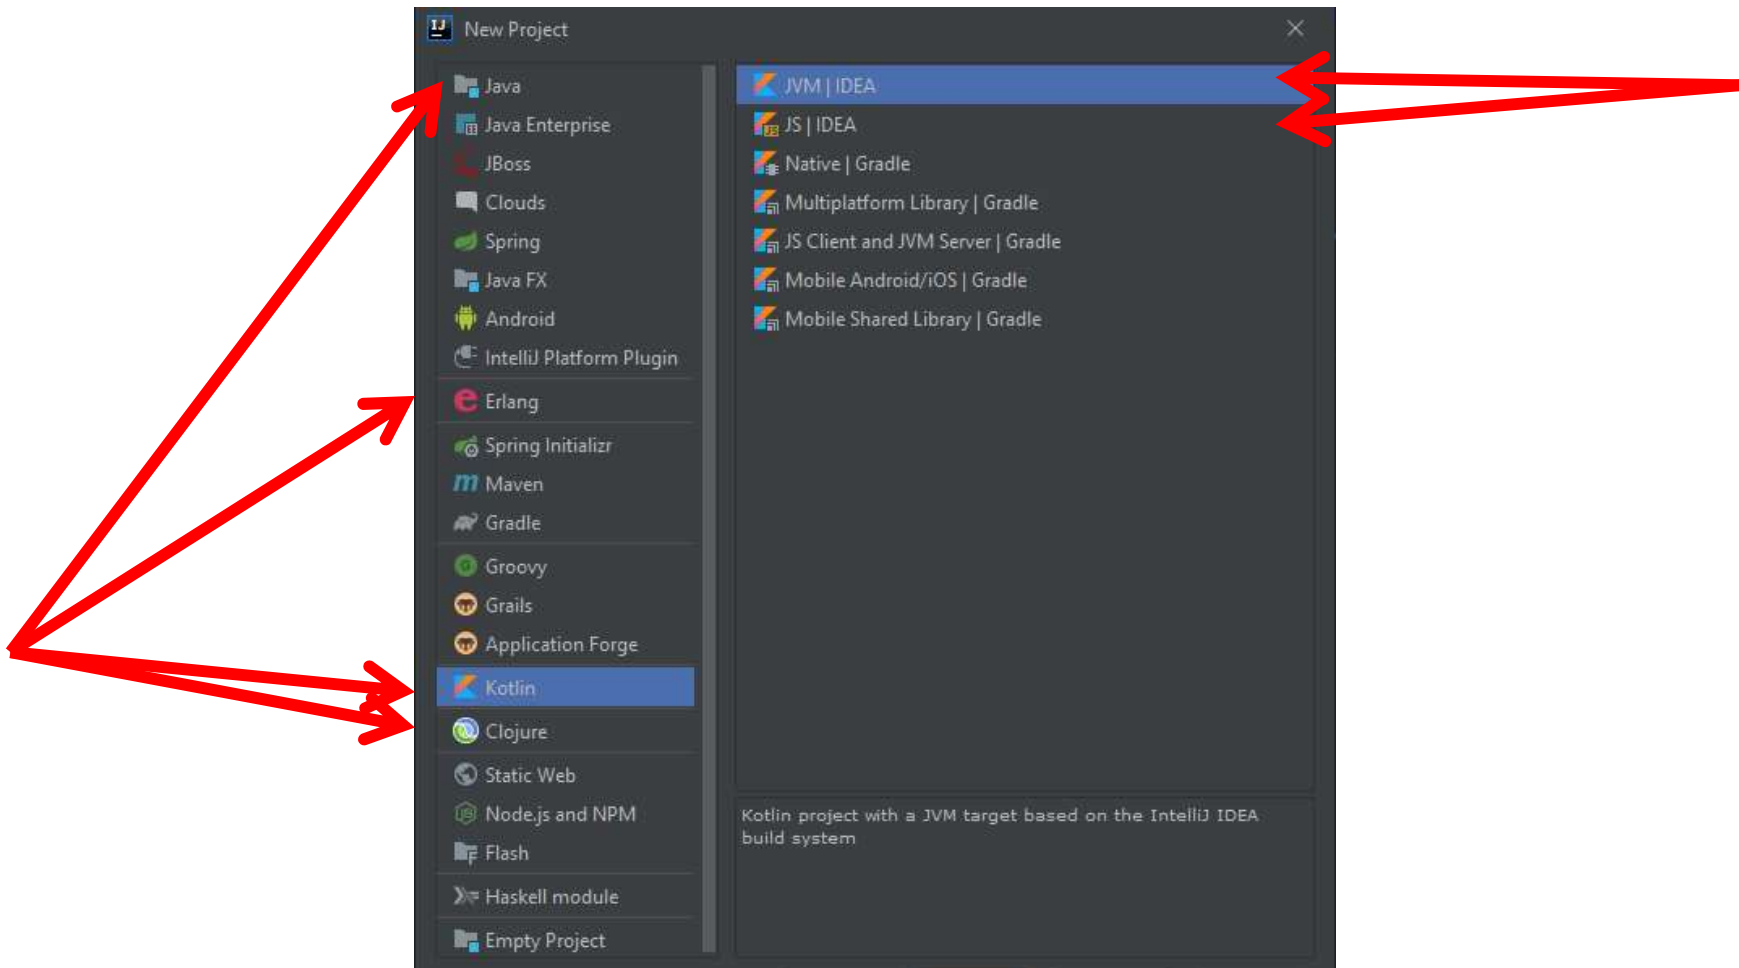

Android **+** Kotlin

Modern Android development with Kotlin (September 2017) Part 1

It is really hard to find one project that covers all the things that are new in Android Development, so I decided to write one. In this article we will use the following:

Literatúra

- Kotlin in Action
  https://github.com/panxl6/Kotlin-in-action/blob/master/ebook/Kotlin_in_Action_v12_MEAP.pdf
- Programming in Kotlin
  https://www.packtpub.com/application-development/programming-kotlin
Literatúra – for nerds

- Kotlin Programming – The Big Nerd Ranch Guide
  https://www.megaknihy.sk/programovanie/20375234-kotlin-programming.html
- Android Programming: The Big Nerd Ranch Guide (4th Edition)
  https://www.bignerdranch.com/books/android-programming-the-big-nerd-ranch-guide-4th/

Literatúra
- https://kotlinlang.org/   Kotlin Playground (https://play.kotlinlang.org/)
- Swift is like Kotlin (http://nilhcem.com/swift-is-like-kotlin/)

Swift
```
print("Hello, world!")
```

Kotlin
```
println("Hello, world!")
```

Constants

prekladový slovník
pre iOSákov

Swift
```
var myVariable = 42
myVariable = 50
let myConstant = 42
```

Kotlin
```
var myVariable = 42
myVariable = 50
val myConstant = 42
```

Kotlin Playground

MY KOAN IS TO COMPREHEND THE SOUND OF ONE HAND CLAPPING.

MINE IS TO FIGURE OUT HOW THIS SMART CARD WORKS.

Java -> Kotlin

„klasický" Java kód pre Fibonacciho s memoizáciou

```java
public class fib {
    static Integer[] table = new Integer[100];
    private static int fib(int n) {
        Integer result = table[n];
        if (result == null) {
            if (n < 2)
                result = 1;
            else
                result = fib(n - 2) + fib(n - 1);
            table[n] = result;
        }
        return result;
    }
    public static void main(String[] args) {
        for(int i = 0; i<20; i++)
            System.out.println("fib(" + i + ")=" + fib(i));
    }
}
```

Automatická konverzia do Kotlinu

Java -> Kotlin
výsledok automatickej konverzie

Čo nás prekvapilo

```kotlin
object fib {
    internal var table = arrayOfNulls<Int>(100)
    private fun fib(n: Int): Int {
        var result: Int? = table[n]
        if (result == null) {
            if (n < 2)
                result = 1
            else
                result = fib(n - 2) + fib(n - 1)
            table[n] = result
        }
        return result
    }
    @JvmStatic fun main(args: Array<String>) {
        for (i in 0..19)
            println("fib(" + i + ")=" + fib(i))
    }
}
```

Už nenájdete pôvodný zdroják

DÚ podobne vygenerované sa neuznajú

if je výraz

- **if** je výraz

```kotlin
fun binCifSum(n : Int) : Int =
    if (n <= 0) 0
    else binCifSum(n/2) + if (n % 2 == 0) 0 else 1
     else binCifSum(n/2) + (n % 2 == 0)

fun binCifSumClassic(n : Int) : Int {
    if (n <= 0) return 0
    else if (n % 2 == 0) return binCifSumClassic(n / 2)
    else return 1 + binCifSumClassic(n / 2)
}

fun main(args:Array<String>) : Unit {
    for (n in 0..10)
        println("binCifSum $n je ${binCifSum(n)}")
}
```

0.kt

when je switch, tiež je to výraz

```kotlin
val kategoria =
    if (vek < 6) "predskolsky"
    else if (vek <= 11) "1.stupen"
    else if (vek <= 18) "2.stupen"
    else "mimo"
val kategoria1 =
    when (vek) {
        in 0..5 -> "predskolsky"
        in 5..11 -> "1.stupen"
        in 12..18 -> "2.stupen"
        else -> "mimo"
    }
var kategoria2 = "mimo"

when (vek) {
    in 0..5 -> kategoria2 = "predskolsky"
    in 5..11 -> kategoria2 = "1.stupen"
    in 12..18 -> kategoria2 = "2.stupen"
}
```

0.kt

For/foreach cyklus

```kotlin
for (x in 1..10) println(x)                      // 1, 2, …, 10
for (x in (1..10).toList()) println(x)           // 1, 2, …, 10
for (x in (10 downTo 1).toList()) println(x)  // 10, 9, …, 1
for (x in 10 downTo 1) println(x)                // 10, 9, …, 1
for (x in 1 until 10) println(x)                 // 1, 2, …, 9
for (x in 1 until 10 step 2) println(x)          // 1, 3, 5, 7, 9
for (x in listOf(2,3,5,7,11,13)) println(x)

for (x in 'a'..'z') println(x)                   // a, b, …, z
for ((index, value) in ('a'..'z').withIndex())
    println("[$index]=$value")                   // [0]=a, [1]=b,…

val map=mapOf(1 to "gula",2 to "zelen",3 to "zalud",4 to"srdce")
for ((key, value) in map) println("[$key]=$value")
                    // [1]=gula, [2]=zelen, [3]=zalud, [4]=srdce
```

0.kt

Cykly

```kotlin
fun main(args: Array<String>) {
    for(a in args)
        print("$a, ")

    for (c in 'A'..'F')
        println(Integer.toBinaryString(c.toInt()))

    for (c in ' '..'z')
        if (c in 'a'..'z' || c in 'A'..'Z')
                print(c)

    for (c in ' '..'z')
        when (c) {
                in '0'..'9' -> println("digit")
                in 'a'..'z', in 'A'..'Z' -> println("letter")
        }
}
```

7.kt

Operátory porovnania

- podobne ako Java `<=, <, >=, >, !=`

ale

`==` je porovnanie hodnôt

`===` je porovnanie referencií

```kotlin
val a = "kot"
val b = "lin"
val c = (a+b).trim()
val d = "kotlin"
println("c==d ${c==d}, c===d ${c===d}")
```

```
c==d true, c===d false
```

`0.kt`

Kolekcie

```kotlin
val set = hashSetOf(2, 3, 5, 7, 11, 13, 17)
val list = arrayListOf(-1, 0, 1)
val map = hashMapOf("sedma" to 7, "osma" to 8, "dolnik" to 11,
                    "hornik" to 12, "kral" to 13, "eso" to 15)

println(set)   println(set.javaClass)
println(list)  println(list.javaClass)
println(map)   println(map.javaClass)

for(x in list)                          // cyklus cez list
   for(y in set)                        // cyklus cez set
      for((key, value) in map)          // cyklus cez map
         println("$x $y $key $value")
```

8.kt

Číselné funkcie, String template

```kotlin
fun fib(n: Int): Int {
    return if (n < 2) 1 else fib(n-1) + fib(n-2)
}
fun fib1(n: Int): Int {
    fun fib(n: Int, a : Int = 0, b : Int = 1): Int {
        return if (n < 0) a else fib(n-1, b, a+b)
    }
    return fib(n)
}

fun main(args: Array<String>) {
    val lst = listOf(1,2,3,4,5,6,7,8,9,10)
    println(lst.map { n -> fib(n) })
    println(lst.map { fib1(it) })
    lst.forEach { println("fib($it) = ${fib1(it)}")}
    for(i in 1..11) println("fib($i) = ${fib1(i)}" )
    println("Maximum:${lst.map { fib(it) }.max()}")
}
```

2.kt

Funkcie

```kotlin
val fcia = { x:Int, y : Int -> println("sucet $x+$y"); x+y}
val proc = { x:Int, y : Int -> println("sucet $x+$y")}

println(fcia(12,7))
proc(13,9)
println({ x:Int -> x+1 }(2))
; // inak neopochopí, že nejde o blok, ale lambda konštantu
{ x:Int -> println(x)}(4)
        // preto jasnejší zápis
run {{ x:Int -> println(x)}(4)}

val delta = 5
println(listOf(1,2,3)
                .map { it + delta}   // x -> x + delta, clojure
                .filter {it % 2 == 0} )
```

Addams Kotlin family

```kotlin
data class Person(val first : String, val name: String,
                  val age: Int? = null,
                  val father : Person?, val mother : Person?)
```

Data class je class s predgenerovanými equals, hashCode, toString, copy

```kotlin
fun main(args: Array<String>) {
    val father = Person("Gomez", "Addams", 156, null, null)
    val mother = Person("Morticia", "Addams", 136, null, null)
    val daugther  = Person("Wednesday", "Addams", 46, father, mother)
    val son  = Person("Pugsley", "Addams", 36, father, mother)
    val family = listOf( father, mother, daugther, son,
        Person("Fester", "Addams", 174, null, null), // uncle
        Person("Pubert", "Addams", null, null, null) // on the picture
    )
    val oldest = family.maxBy { it.age ?: 0 }
    println("The oldest is: $oldest")
}
```

1.kt

Funkcie

```kotlin
println(family.map { it.first })  // mapToObj
println(family.filter { it.age?:0 > 100 } )
println(family.all { it.age?:0 < 100 } )
println(family.all { it.name == "Dracula" } )
println(family.groupBy { it.father } )
println(family.filter {
    it.age == family.maxBy { person: Person -> person.age?:0 }?:0 } )
Ak by .age bol Int, nie Int?
    it.age == family.maxBy { person: Person -> person.age }?:0 } )

val numbers = mapOf(0 to "zero", 1 to "one")
for((father, persons) in family.groupBy { it.father })
    println("${persons.size} ma otca $father")

println(listOf("a", "aba", "b", "ba", "abba").groupBy { it.length })
println(listOf("a", "aba", "b", "ba", "abba").flatMap { it.toList() })
```

10.kt

Funkcie

```kotlin
class Book(val title: String, val authors: List<String>)
val books = listOf(
        Book("Action in Kotlin", listOf("Dmitry Jemerov", "Svetlana Isakova")),
        Book("Mort", listOf("Terry Pratchett")),
        Book("Good Omens", listOf("Terry Pratchett", "Neil Gaiman")),
        Book("Discworld", listOf("Terry Pratchett", "Paul Kidby")))
println(books.flatMap { it.authors }.toSet())

listOf(1, 2, 3, 4)
        .asSequence()
            .map { print("map($it) "); it * it }
            .filter { print("filter($it) "); it % 2 == 0 }
        .toList()

val nats = generateSequence(1) { it + 1 }
println(nats.takeWhile { it <= 100 }.sum())
println(nats.takeWhile { it <= 10 }.reduce({ x:Int, y : Int -> x*y}))
```

Break point

pokračovanie na budúce

Properties

```kotlin
data class Rectangle(val height: Int, val width: Int) {
    val isSquare: Boolean
            get() {
                return height == width
            }
    fun size():Int {
        return height * width
    }
}

fun main(args: Array<String>) {
    val rect = Rectangle(41, 43)
    println("Toto $rect je stvorec: ${rect.isSquare}")
    println("Obsah $rect je: ${rect.size()}")
}
```

3.kt

Enumerables, when

(sú aj v Jave 5+)

```kotlin
enum class Color { RED,ORANGE,YELLOW,GREEN,BLUE,INDIGO,VIOLET }

enum class Colour(val r: Int, val g: Int, val b: Int) {
    WHITE(0, 0, 0), RED(255, 0, 0),  YELLOW(255, 255, 0),
    GREEN(0, 255, 0), BLUE(0, 0, 255), BLACK(255, 255, 255);
    fun rgb() = (r * 256 + g) * 256 + b
}

fun getMnemonic(c : Colour) = {
    when (c) {
        Colour.WHITE -> "Biela"
        Colour.BLACK -> "Biela"
        else         -> "Seda"
    }
}
```

4.kt

Enumerables, when

(when alias switch)

```kotlin
fun mix(c1: Color, c2: Color) =
    when (setOf(c1, c2)) {
        setOf(Color.RED, Color.YELLOW) -> Color.ORANGE
        setOf(Color.YELLOW, Color.BLUE) -> Color.GREEN
        setOf(Color.BLUE, Color.VIOLET) -> Color.INDIGO
        else -> throw Exception("Dirty color")
    }

fun mixOptimized(c1: Color, c2: Color) =
    when {
        (c1 == Color.RED && c2 == Color.YELLOW) -> Color.ORANGE
        (c1 == Color.YELLOW && c2 == Color.BLUE) -> Color.GREEN
        (c1 == Color.BLUE && c2 == Color.VIOLET) -> Color.INDIGO
        else -> throw Exception("Dirty color")
    }
```

4.kt

Derivácia

```kotlin
interface Expr                                  // abstract class
enum class Operator { Plus, Times }
data class Num(val value: Int) : Expr           // subclass, extends
data class Variable(val variable: String) : Expr
data class Op(val operator: Operator, val left:Expr, val right:Expr):Expr

fun derive(e: Expr, variable : String): Expr {
    if (e is Num) { return Num(0) }             // typeof
    else if (e is Variable) {                   // typeof
        return if (e.variable == variable) Num(1) else Num(0) // typecast
    } else if (e is Op) {
        when(e.operator) {      // vie, že e:Expr je Op, ((Op)e).operator
            Plus -> return Op(Plus,
                    derive(e.left, variable), derive(e.right, variable))
            Times -> return Op(Plus,
                    Op(Times, derive(e.left, variable), e.right),
                    Op(Times, derive(e.right, variable), e.left))
        }
    }
    throw IllegalArgumentException("Unknown expression")
}
```

5.kt

Zjednodušovanie

```kotlin
fun simplify(e: Expr):Expr {
    when (e) {
        is Op -> {
            when (e.operator) {
                Operator.Plus -> {
                    return
                    if (e.left is Num && e.right is Num)
                        Num(e.left.value + e.right.value)
                    else if (e.left == Num(0)) simplify(e.right)
                    else if (e.right == Num(0)) simplify(e.left)
                    else e.copy(left = simplify(e.left), right = simplify(e.right))
                }

            else -> return e
        }
    }
    return e
}
```

5.kt

Metódy

```kotlin
sealed class Expression {
    data class Num(val value: Int) : Expression()
    data class Variable(val variable: String) : Expression()
    data class Op(val operator: Operator,
        val left: Expression, val right: Expression) : Expression()

    fun derive(variable : String): Expression {
        if (this is Num) {          // typeof
            return Num(0)
        } else if (this is Variable) {
            return if (this.variable == variable) Num(1) else Num(0)

    fun simplify(): Expression {
        when (this) {
            is Op -> {
```
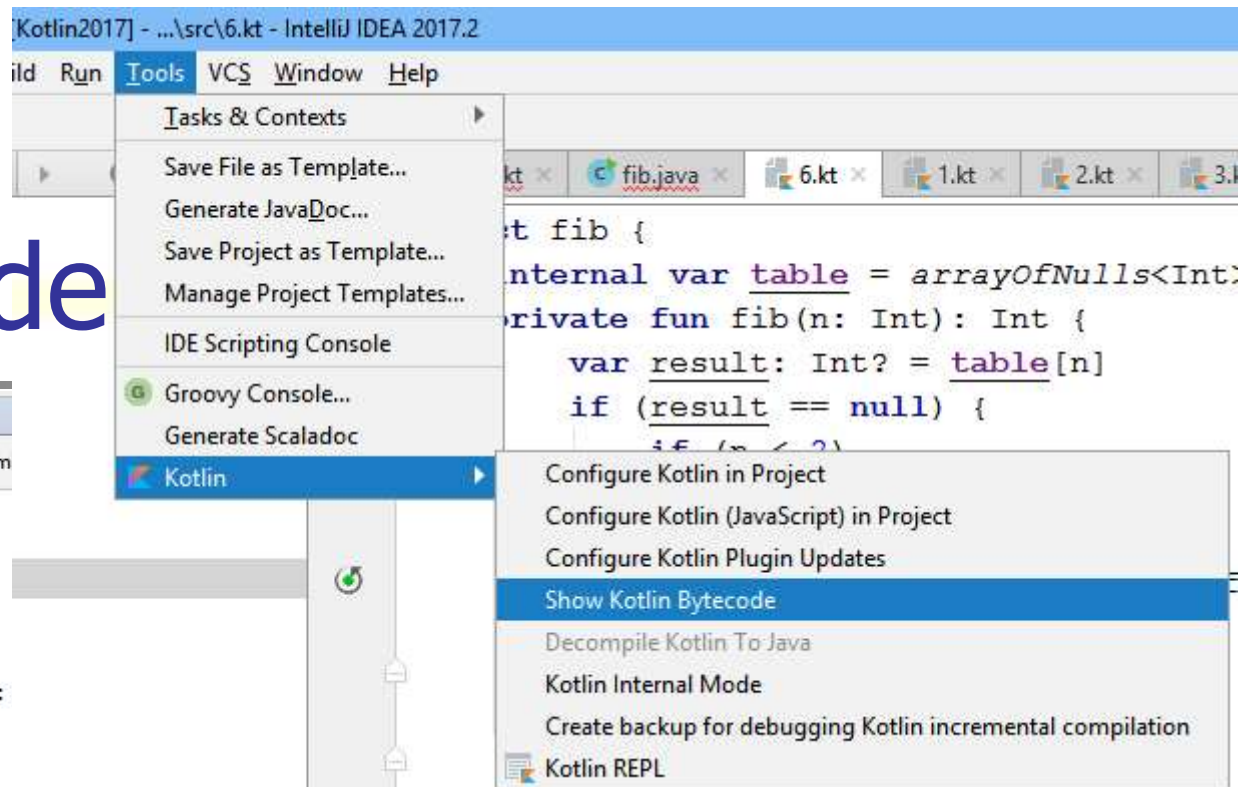

9.kt

ByteCode

Videli ste už niekedy kompilát vášho kódu

Decompile
(vidíte len časť main – ale je to .java)

```java
@JvmStatic
public static final void main(@NotNull String[] args) {
    Intrinsics.checkParameterIsNotNull(args, "args");
    int i = 0;
    byte var2 = 19;
    if (i <= var2) {
        while(true) {
            String var3 = "fib(" + i + ")=" + INSTANCE.fib(i);
            System.out.println(var3);
            if (i == var2) {
                break;
            }
            ++i;
        }
    }
}
```

6.kt

Nullables

V Jave je String skutočný retazec alebo null

V Kotline String je LEN skutočný reťazec a null nepatrí do typu String

Existuje String? čo je String alebo null, vo všobecnosti: T? = T ∪ null

T? Podobne vo Swingu, Java Optional[T] =, Scala Option[T]

```kotlin
fun foo(str : String?) {
    println(str)
    if (str != null) println(str.toUpperCase())
    println(str?.toUpperCase())      // safe call operátor
                        // x?.m == if (x != null) x.m else null

}

fun stringLen(s: String?): Int = s?.length?:0 // Elvis operátor
if (if (s == null) then null else s.length) == null then 0 else s.length

fun nonEmptystringLen(s: String?): Int {
    val sNotNull: String = s!!          // určite nebude null,
            // ak bude tak exception kotlin.KotlinNullPointerException
    return sNotNull.length
}
```

11.kt

Nullables

- Safe call

  o ?. m() = if (o == null) null else o.m()

- Elvis operátor

  o ?: default = if (o == null) default else o

- Safe cast

  o as? T = if (o typeof T) o else null

- Not-null assertion

  o!! = if (o != null) o else N.P.E.

- let

  o?.let {…it…} = if (o != null) {…it <- o…}

Immutables

Collection	Immutable	Mutable

List	listOf()

Podtriedy a polymorfizmus

Zviera
```kotlin
open class Zviera {                    // open znamená nie final
    open fun pozdrav() { }             // open znamená nie final
}
class Macka : Zviera() {               // Macka je podtrieda Zviera
    override fun pozdrav() { println("mnau") }
}
class Pes : Zviera() {                 // Pes je ine Zviera
    override fun pozdrav() { println("haf") }
}

class Stado<T : Zviera>() {            // stádo implementujeme ako
    var lst: MutableList<T> = mutableListOf() // mutable list je zámer
    val size: Int get() = lst.size
    operator fun get(i: Int): T {      // T je v out pozícii
        return lst.get(i); }           // operátor dovolí stado[i]
    operator fun set(i: Int, v: T) {   // T je v in pozícii
        lst.set(i, v)                  // operátor dovolí stado[i] = v
    }
}
```

13.kt

Podtriedy a polymorfizmus
(variancie – covariancia a contravariancia – teória)
Zviera

Macka je podtrieda Zviera, Macka <: Zviera
Pes je podtrieda Zviera, Pes <: Zviera

Stado<T : Zviera> je parametrický typ pre ľubovoľný podtyp T typu Zviera

Stado<Macka> ani Stado<Pes> ale **<u>nie je</u>** podtrieda Stado<Zviera>

Stado je na parameter T invariantné

Ak ale chceme, aby Stado<Macka>, Stado<Pes> BOLI podtrieda Stado<Zviera>,
horoví sa tomu covariancia, potom stado musí byť deklarované takto:

class Stado<**out** T : Zviera>() { ... }   // Stado[Macka] <: Stado[Zviera]

Ak chceme, aby XYZ<Zviera> BOLA podtrieda XYZ<Macka>,
horoví sa tomu contravariancia, potom stado musí byť deklarované takto:

class XYZ<**in** T : Zviera>() { ... }   // XYZ[Zviera] <: XYZ[Macka]

13.kt

Podtriedy a polymorfizmus

(stado je invariantné)

Zviera

```kotlin
fun pozdravitVsetky(zvery : Stado<Zviera>) {
    for (i in 0 until zvery.size)
        zvery[i].pozdrav()
}

fun pozdravitMacky(macky : Stado<Macka>) {
    for (i in 0 until macky.size)
        macky[i].pozdrav()          // macky[i] : Macka, preto .pozdrav()

    pozdravitVsetky(macky)          // toto nejde lebo macky : Stado<Macka>
                                    // to nie je podtyp Stado<Zviera>

    pozdravitVsetky(macky as Stado<Zviera>) // smart Cast
                // povie kompilátoru, že ver mi, macky : Stado<Zviera>
                // kompilátor uverí a zavolá funkciu

    pozdravitVsetky(macky)          // toto uz ide, lebo kompilátor uveril
                                    // že macky : Stado<Zviera>
}
```
13.kt

Podtriedy a polymorfizmus

(stado je invariantné a zneužijeme toho)

Zviera

```
val stado = Stado<Macka>()              // main
stado.append(Macka())
stado.append(Macka())
stado[1] = Macka()                      // ilustrácia operátora set
val m = stado[0]                        // ilustrácia operátora get
pozdravitMacky(stado)

stado[1] = Pes()                        // nejde, lebo Macka nie je podtrieda Pes
stado.append(Pes())                     // nejde, lebo Macka nie je podtrieda Pes
pozdravitVsetky(stado)       // Stado<Macka> nie je podtrieda Stado<zviera>
                                        // tzv. Smart cast
pozdravitVsetky(stado as Stado<Zviera>)   // ale presvedčíme kompilátor
stado[1] = Pes()                        // a už nám verí
stado.append(Pes())                     // oklamali sme ho ☺ ☺ ☺ ☺ ☺

pozdravitVsetky(stado)                  // stado as Stado<Zviera> to on už vie !
pozdravitMacky(stado)                   // toto on kompilátor vie, ale keďže
                            // sme ho oklamali, vypomstí sa nám v runtime

Exception "main" java.lang.ClassCastException:Pes cannot be cast to Macka
Hádanka: na ktorom riadku to padlo ?
```

13.kt

Covariancia
(prvý pokus - stado snáď bude covariantné)

Ak ale chceme, aby Stado<Macka>, Stado<Pes> BOLI podtriedy Stado<Zviera>, tak to nejde takto:

```kotlin
class Stado<out T : Zviera>() {              // v scale Stado[+T]
    var lst: MutableList<T> = mutableListOf()
                // T je deklarované ako out je v invariant pozícií
    val size: Int get() = lst.size
    operator fun get(i: Int): T { return lst.get(i); }
                // T je deklarované ako out je v out pozícií, ok ☺
    operator fun set(i: Int, v: T) { lst.set(i, v) }
                // T je deklarované ako out je v in pozícií
    fun append(v: T) { lst.add(v) }
                // T je deklarované ako out je v int pozícií
}
    Scala: covariant argument in contravariant position ...
```

Veľmi zjednodušene:

out je výstupný argument, **in** je vstupný argument metódy

Viac: https://kotlinlang.org/docs/reference/generics.html

14.kt

Covariancia

(druhý pokus - stado už bude covariantné za cenu ...)

Zviera

Ak ale chceme, aby Stado<Macka>, Stado<Pes> BOLI podtriedy Stado<Zviera>:

- nesmie mať žiadnu metódu so vstupným argumentom :T, lebo ten je out
- ako štruktúru naplniť, modifikovať ? jedine v konštruktore
- ergo, je to nemodifikovateľná [**immutable**] štruktúra/trieda/typ

```kotlin
class Stado<out T : Zviera>(val lst : List<T>) {
    val size: Int get() = lst.size
    operator fun get(i: Int): T { return lst.get(i); }
                // T je deklarované ako out je v out pozícii, ok ☺
    //operator fun set(i: Int, v: T) { lst.set(i, v) }
    //fun append(v: T) { lst.add(v) }
    // var lst2: MutableList<T> = mutableListOf()
}
fun pozdravitMacky(macky : Stado<Macka>) {
    pozdravitVsetky(macky)         // toto ide lebo macky:Stado<Macka>,
}                                  // to je podtyp Stado<Zviera>

val stado = Stado<Macka>(listOf(Macka(), Macka()))
pozdravitVsetky(stado)
```

`14.kt`

Contravariancia
()

```kotlin
abstract class Zviera(val size : Int = 0) { }
data class Macka(val krasa : Int) : Zviera(1) { }
data class Pes(val dravost : Int) : Zviera(2) { }
// alias comparable
interface Compare<in T> {
    fun compare(z1: T, z2: T): Int
}

val MackaCompare : Compare<Macka> = object: Compare<Macka> {
    override fun compare(m1: Macka, m2: Macka): Int {
        println("macky$m1 a $m2 si porovnavaju  ${m1.krasa} a ${m2.krasa}")
        return m1.krasa - m2.krasa
    }
}

// val ZvieraCompare: Compare<Zviera> = MackaCompare // pre contravar...
val ZvieraCompare: Compare<Zviera> = object: Compare<Zviera> {
    override fun compare(z1: Zviera, z2: Zviera): Int {
        println("zviera $z1 a $z2 si porovnavaju ${z1.size} a ${z2.size}")
        return z1.size - z2.size
    }
}   }
```

Contravariancia (in):
Macka <: Zviera =>
Compare[Zviera] <: Compare[Macka]

podtyp

nadtyp

15.kt

Zhrnutie

(covariancia, contravariancia, invariancia)

Covariant	Contravariant	Invariant
Producer<**out** T>	Consumer<**in** T>	MutableList<T>
$T_1 <: T_2 => G[T_1] <: G[T_2]$ Príklad: Producer<Macka> je podtyp Producer<Zviera> Skutočný príklad: interface List<out E>: Collection<E>	$T_1 <: T_2 => G[T_2] <: G[T_1]$ Príklad: Consumer<Zviera> je podtyp Consumer<Macka> Skutočný príklad: Interface Comparable<in E>	$T_1 <: T_2 =>$ $G[T_1]$ a $G[T_2]$ nemajú ŽIADEN vzťah
T môže byť len v **out** pozícií, napr. výsledok fcie	T môže byť len v **in** pozícií, napr. vstup do fcie	T môže byť v ľubovoľnej pozícií

https://kotlinlang.org/docs/reference/generics.html

No fajn, hneď je to jasnejšie ☺

Kotlin: má pre co/contra-varianciu out/in

Scala: +/-

A ako to bolo v Jave ?
- Stado<? extends Zviera>
- Compare<? Super Macka>
